Mechanisation
in our own
hands

The selection of the planting material already takes place at the specialised nurseries of the base / starting material. This planting material grows and develops at Sint-Oedenrode. By applying an efficiently run planning system, all trees are transplanted after three, four or five years to be able to develop a perfectly branched root system. This guarantees taking root after planting at the definitive place at the client's.

The growing techniques have been mechanised where possible. Our own technical department designs and builds in co-operation with an engineering company plant and lifting machines that are perfectly suited for their task.

To facilitate the supply, removal and transplanting

of trees, a dense network of paved paths has been built.

Spacious loading and unloading berths at the distribution hall allow for a fast handling of orders.

Transport of a *Quercus palustris*, the first tree for the Floriade 2002.
