

In-house fleet of machines

Van den Berk Nurseries has a large number of its own machines, which means that digging out and delivery can be carried out rapidly in the digging season. The nursery is therefore independent of commissioned workers and that means that your orders can be processed and delivered more rapidly.

Self-built **mammoth digging machine** that can dig out rootballs with a maximum diameter of 2.6 metres.

Prior to planting the **soil is enriched** with organic fertiliser.

The Pazzaglia digs out a size 60-70 Sophora japonica by shovelling completely under the rootball.

We move heavy trees with the **three-point technique**.
