Quercus acutissima

6 - 12 (20) m
6-12m
broad ovoid, dark, dense crown
brownish-grey, later with deep grooves, twigs somewhat angular, very hairy
elongated to lanceolate, needle-like serrations, green, 10 - 20 cm
gold coloured catkins, 10 - 15 cm long, May
brown acorns, approx. 2 cm long, ripen early
None
usually not toxic to people, (large) pets and livestock
slightly acid and well drained
suitable for wet soil
tolerates no paving
6 (-23,3 to -17,8 °C)
good
resistant to frost (WH 1 - 6), can withstand wind, resistant to de-icing salt
industrial areas
clearstem tree, multi-stem treem
Japan, China, Korea
Quercus serrata

Attains a height of 20 m in its natural habitat but only 6 - 12 m in Europe. Very dense branches grow on a trunk that remains slim. The crown is closed and grows to a broad ovoid shape. Young twigs are angular and very hairy, later bare, and they have lenticels. Reddish-brown buds grow on the greyish-brown twigs. The leaves resemble those of Castanea and are matt glossy and dark green. Their shape is variable, usually elongated to lanceolate. The 10 to 20 lateral veins end along the leaf edge in needle-like serrations. The leaves are 10 - 20 cm long and 2.5 - 6 cm wide. The female flowers are unremarkable: the male flowers grow in catkins 10 - 15 cm long. The acorns are half to two-thirds enclosed in a semi-circular cupule covered with narrow scales.
