*Robinia x ambigua* is a hybrid between *R. pseudoacacia* and *R. viscosa*. It has many similarities with *R. pseudoacacia* but its leaves are slightly smaller. The sticky, young twigs are characteristic of *R. viscosa*. 'Bellarosea' is a small tree with an elegant shape. The crown is rounded and open. Unlike *R. x ambigua*, 'Bellarosea' has branches bearing strong thorns. The imparipinnate leaves are about 24 cm in size and consist of 13 - 21 elliptical green leaf segments. Pendulous, loose clusters of large pink flowers appear in June. The flowering period lasts into August. The branches are breakable: inclement weather conditions can cause branches to break particularly when the tree is in full bloom. Consequently, a site sheltered from the wind is required. *Robinia x ambigua* is not very sensitive to road salt and tolerates paving well.
